

Accountable AI Deployment Act of 2026

If it can act, it must be accountable.

The Problem

AI systems are making decisions that affect jobs, healthcare, finances, and public safety. When harm occurs, responsibility is often unclear and difficult to enforce.

The Solution

The AADA establishes a clear standard: accountability must be built into AI systems before they act—not after harm occurs.

Core Principles

- Systems cannot take unauthorized actions.
- Decisions must be traceable and reconstructable.
- Safety cannot be overridden for convenience or performance.
- Responsibility remains with the entity deploying the system.

Why It Matters

Modern infrastructure—finance, aviation, and healthcare—requires auditability, safety controls, and clear accountability. AI systems should meet the same standard.

Outcome

With AADA, accountability is not optional. It is enforced as a property of the system itself.
